

Digital Storytelling

pedagogical method in on-line education

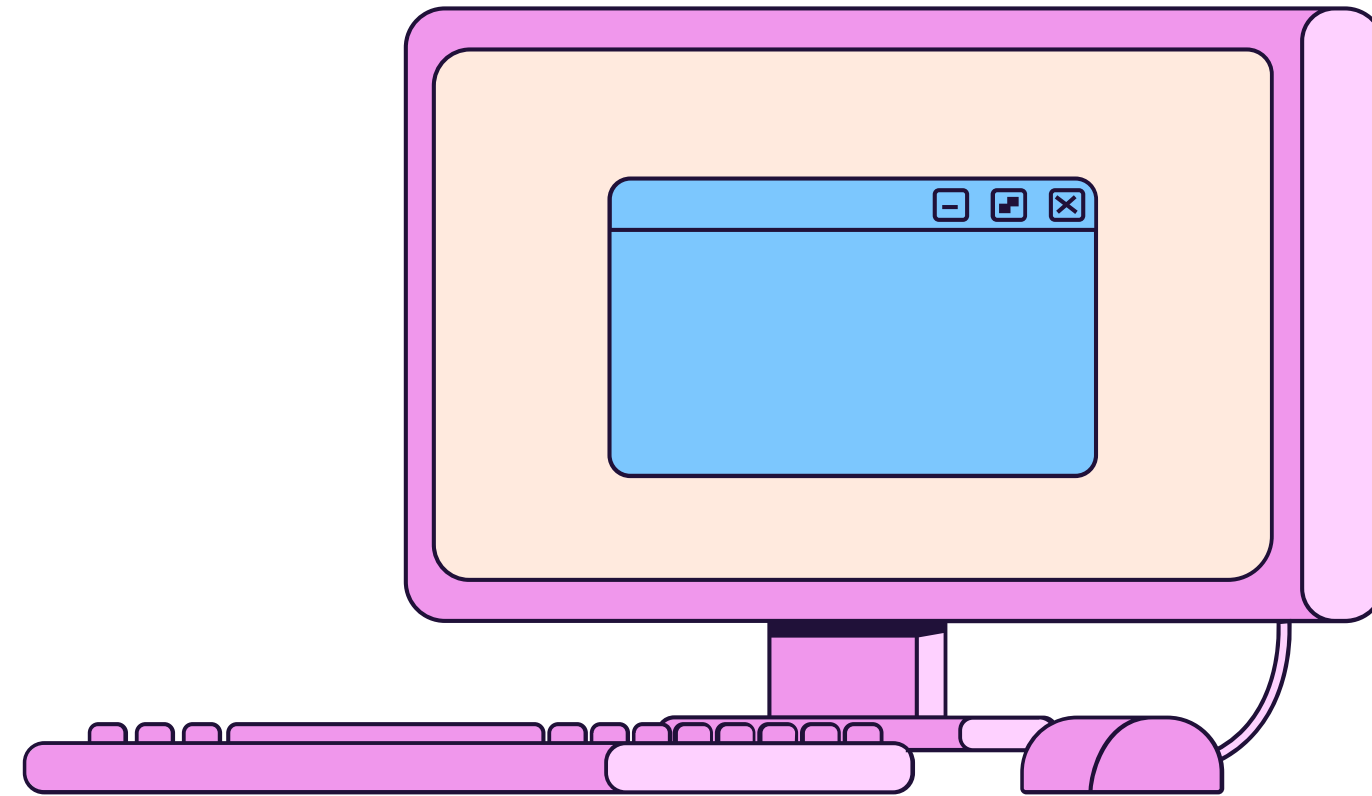

- Due to the necessity to introduce remote work, completely new pedagogical methods had to be developed. The problem turned out to be not only distance education, but most of all students' health problems, technical difficulties and gradually declining motivation. For this reason, the newly introduced methods naturally had to take into account the above.

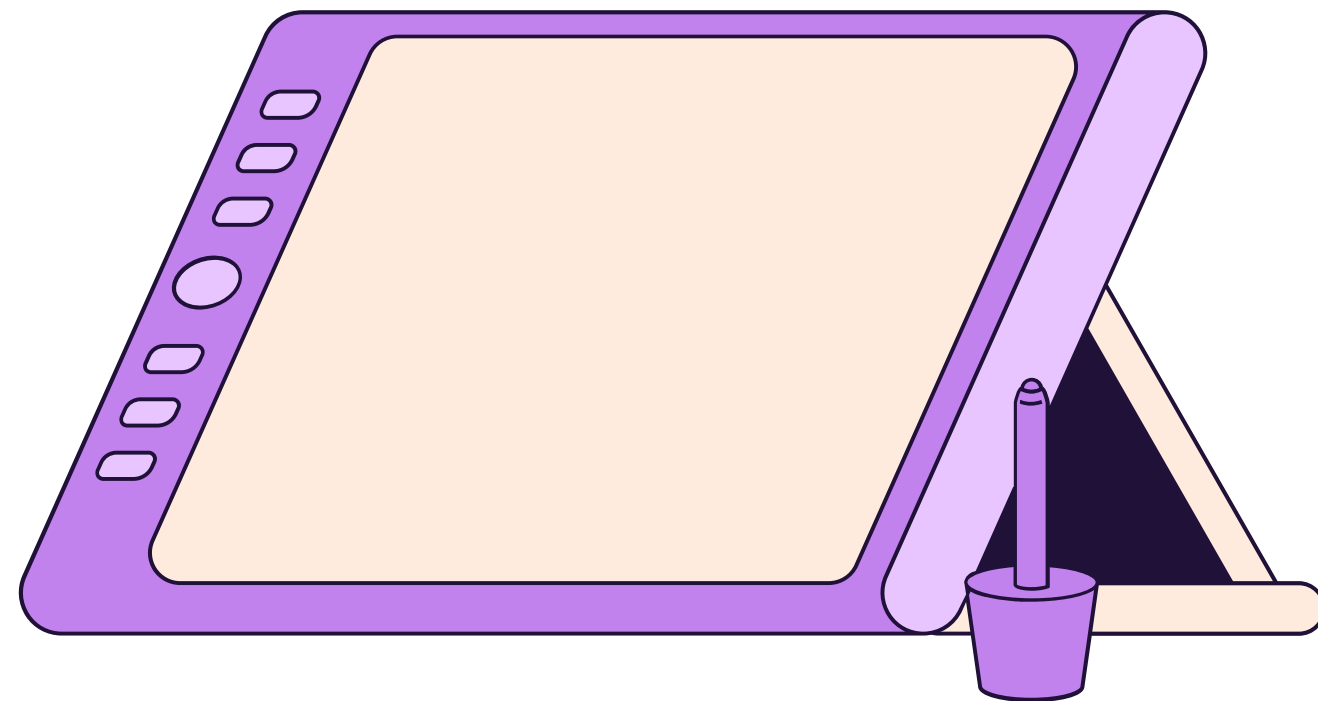

The educational group was offered a completely new activity, developed especially for them and adapted to the new conditions. The task of the students was to jointly create a literary story - fairy tales about the adventures of their peer.

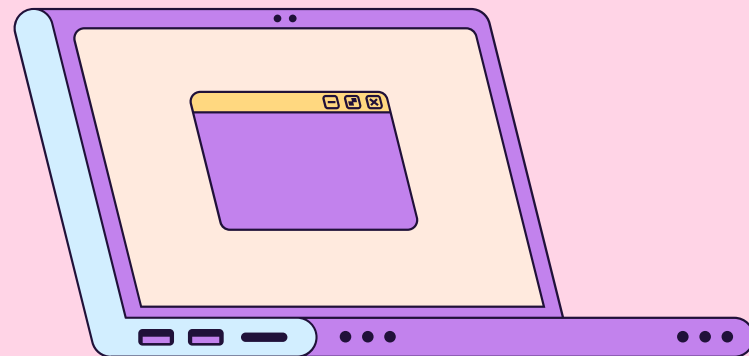

Each of the pupils was to create one sentence at a given time and pass it on to the rest. Therefore, everyone had to be equally active in the task, because excluding one person might have interrupted the activity and not allow it to continue.

Final Project

The pupils had to keep in touch and cooperate with each other, and therefore they started to motivate each other. It soon turned out that some kind of compulsion was replaced by a true willingness to cooperate and a passion for creation

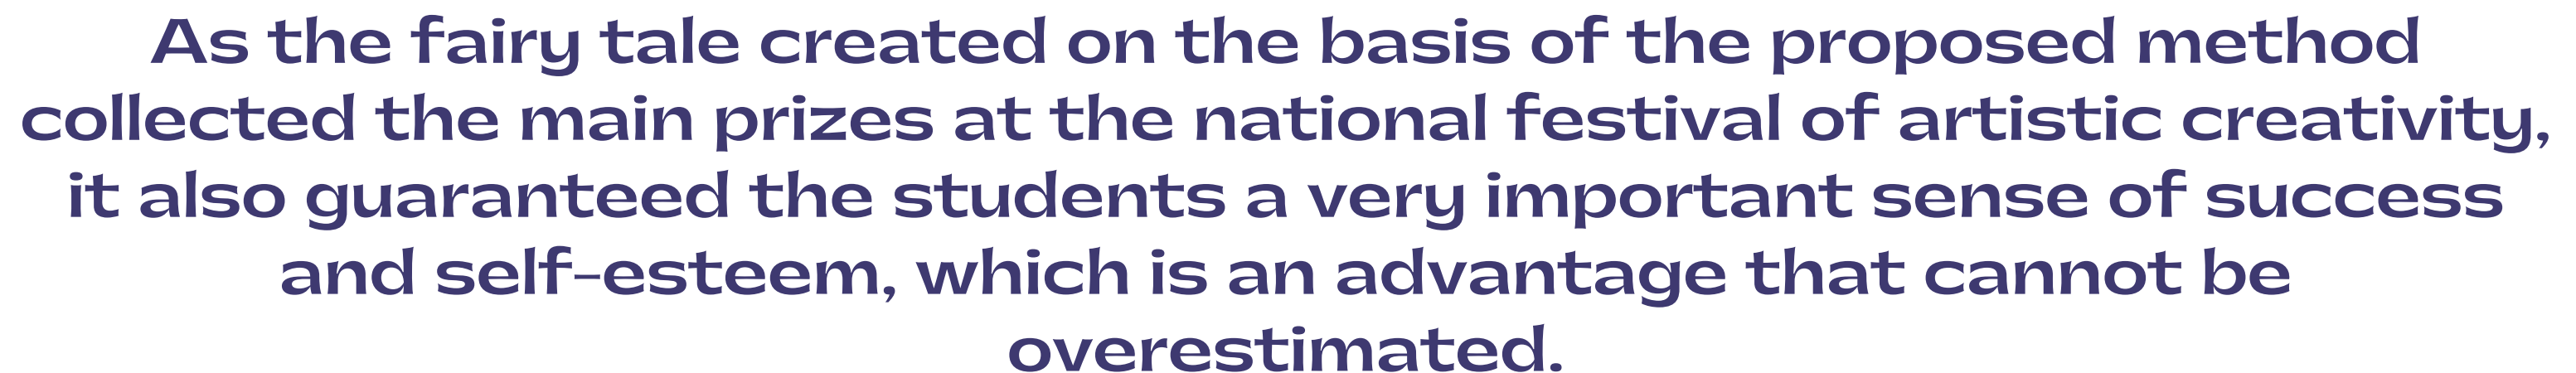

Values

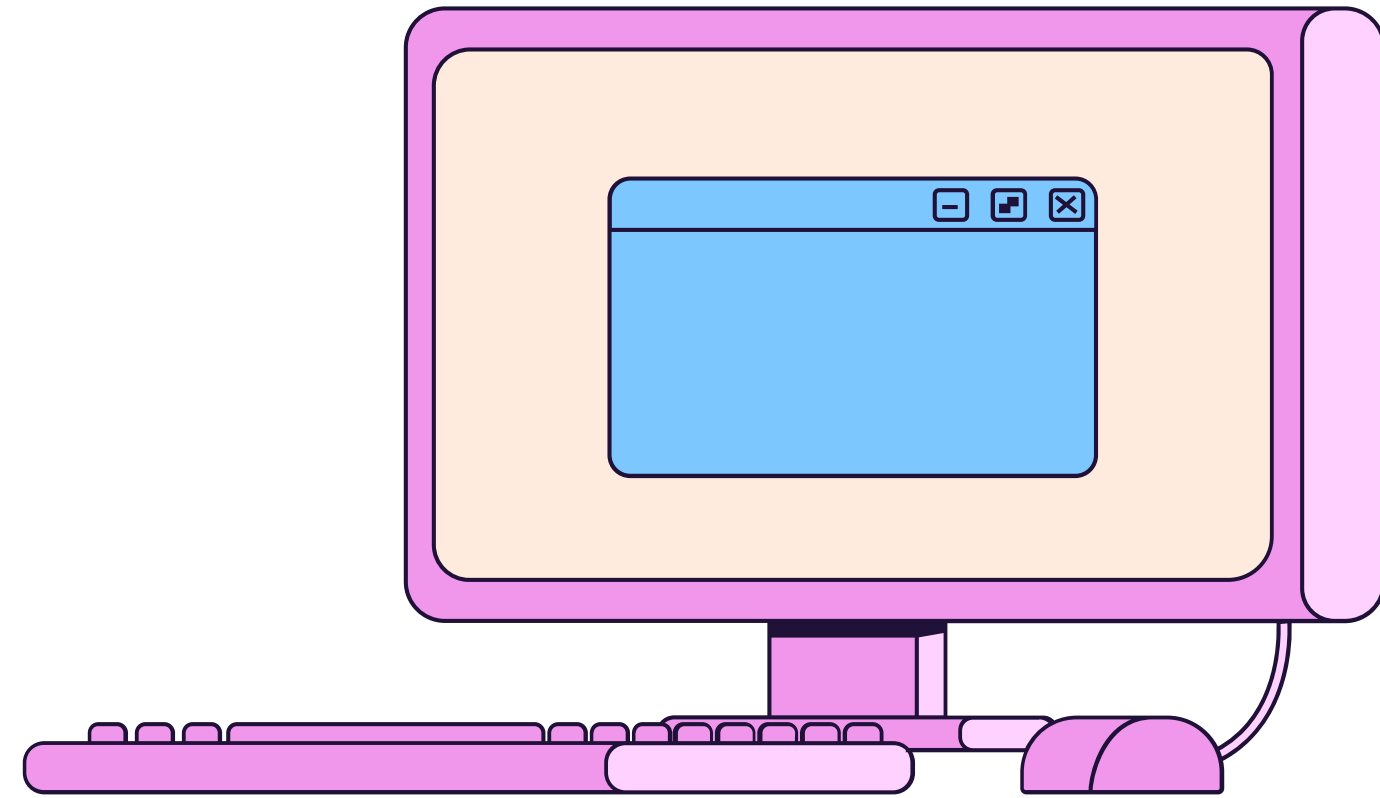

increasing the level of motivation
improving the ability to cooperate
awakening creativity
raising the level of written and oral statements
discovering new passions and talents of students

Success!

As the fairy tale created on the basis of the proposed method collected the main prizes at the national festival of artistic creativity, it also guaranteed the students a very important sense of success and self-esteem, which is an advantage that cannot be overestimated.

this method can be used in different age groups in students with different educational possibilities, of course then appropriately modified and adapted to their individual skills.
